**Abstract:** A curve X of genus g over a finite field is *supersingular* if the Newton polygon of its L-polynomial is a line segment of slope 1/2.

Equivalently, X is supersingular if and only if the Jacobian Jac(X) is isogenous to a product of supersingular elliptic curves.

Only in rare cases is Jac(X) isomorphic to a product of supersingular elliptic curves, in which case X is called *superspecial*.

I will define the *superspecial rank*, which is an invariant of the Dieudonné module or Ekedahl-Oort type of a p.p. abelian variety.

If X is a supersingular curve, then the superspecial rank determines the number of elliptic factors in the decomposition of Jac(X) up to isomorphism.

As examples, we compute the superspecial rank of Hermitian curves and Suzuki curves. I will describe results about the superspecial rank of curves in characteristic 2.

## Overview

An elliptic curve  $E/\overline{\mathbb{F}}_p$  can be ordinary or supersingular. How do you generalize supersingular property? Study: abelian varieties of dimension g > 1 and curves of genus g > 1.

- **A.** *p*-rank *f* = 0
- B. supersingular
- C. superspecial

Today: define superspecial rank (invariant of Dieudonneé module) differentiating B and C for curves

Motivation - supersingular elliptic rank of supersingular Jacobians Examples (with Elkin, Weir, Malmskog)

Another day: Newton polygon results - differentiating A and B for curves

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

# Supersingular elliptic curves

Let *E* be a smooth elliptic curve over  $k = \overline{k}$ , with char(k) = *p*.

Let E[p] be the kernel of the inseparable multiplication-by-p morphism.

*E* is **supersingular** if it satisfies the following equivalent conditions:

**A.** The only *p*-torsion point is the identity:  $E[p](k) = {id}$ .

**B.** The Newton polygon of *E* is a line segment of slope  $\frac{1}{2}$ .

**C.** The group scheme E[p] contains 1 copy of  $\alpha_p$ , the kernel of Frobenius on  $\mathbb{G}_a$ .

For all *p*, there exists a supersingular elliptic curve *E* over  $\mathbb{F}_{p^2}$  (Igusa).

Pries (CSU)

# These properties are not all the same when g > 1

Let *A* be a p.p. abelian variety of dimension *g* over  $k = \overline{k}$ , char(k) = *p*. Let *A*[*p*] be the kernel of the inseparable multiplication-by-*p* morphism.

The following conditions are all different for  $g \ge 3$ .

**A.** *p***-rank** 0 - The only *p*-torsion point is the identity:  $A[p](k) = {id}$ .

**B.** supersingular - The Newton polygon of A is a line of slope  $\frac{1}{2}$ .

**C. superspecial** - The group scheme A[p] contains g copies of  $\alpha_p$ , the kernel of Frobenius on  $\mathbb{G}_a$ .

Then  $C \Rightarrow B \Rightarrow A$ .

**Goal:** study  $A \Rightarrow B \Rightarrow C$  for Jacobians of curves of genus  $g \ge 3$ .

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

# B. Definition of Newton polygon

Let X be a smooth projective curve defined over  $\mathbb{F}_q$ . Zeta function of X is  $Z(X/\mathbb{F}_q, t) = L(X/\mathbb{F}_q, t)/(1-t)(1-qt)$ 

where 
$$L(X/\mathbb{F}_q,t) = \prod_{i=1}^{2g} (1 - w_i t) \in \mathbb{Z}[t]$$
 and  $|w_i| = \sqrt{q}$ .

The Newton polygon of X is the NP of the *L*-polynomial L(t). Find *p*-adic valuation  $v_i$  of coefficient of  $t^i$  in L(t). Draw lower convex hull of  $(i, v_i/a)$  where  $q = p^a$ .

**Facts:** The NP goes from (0,0) to (2g,g). NP line segments break at points with integer coefficients; If slope  $\lambda$  occurs with length  $m_{\lambda}$ , so does slope  $1 - \lambda$ .

## Definition

 $X/\mathbb{F}_q$  is *supersingular* if the Newton polygon of  $L(X/\mathbb{F}_q, t)$  is a line segment of slope 1/2.

There is a partial ordering on NPs; the supersingular NP is 'smallest', and

Pries (CSU)

sspecial rank of ssingular curves

Let A be a p.p. abelian variety of dimension g over k.

**Manin:** for *c*, *d* relatively prime s.t.  $\lambda = \frac{c}{d} \in \mathbb{Q} \cap [0, 1]$ , define a *p*-divisible group  $G_{c,d}$  of dimension *c* and height *d*.

The Dieudonné module  $D_{\lambda}$  for  $G_{c,d}$  is a W(k)-module. Over  $\operatorname{Frac}(W(k))$ , there is a basis  $x_1, \ldots, x_d$  for  $D_{\lambda}$  s.t.  $F^d x_i = p^c x_i$ .

There is an isogeny of *p*-divisible groups  $A[p^{\infty}] \sim \bigoplus_{\lambda} G_{c,d}^{m_{\lambda}}$ .

Newton polygon: lower convex hull - line segments of slope  $\lambda$  and length  $m_{\lambda}$ .

**Definition:** A supersingular iff  $\lambda = \frac{1}{2}$  is the only slope.

## Existence of supersingular objects

#### Abelian varieties:

For all p and g, there exists a supersingular p.p. abelian variety of dimension g, namely  $E^g$ .

Let  $\mathcal{A}_g$  be the moduli space of p.p. abelian varieties of dimension g. The supersingular locus of  $\mathcal{A}_g$  has dimension  $\lfloor \frac{g^2}{4} \rfloor$ .

Smooth Curves: Many experts on supersingular curves are here.

### Van der Geer/Van der Vlugt:

If p = 2, there exists a supersingular curve of every genus.

### Open problem

For  $p \ge 3$ , it is unknown if there exists a supersingular curve of every genus.

Let  $q = p^n$ . The Hermitian curve  $X_q$  has affine equation  $y^q + y = x^{q+1}$ .

It has genus g = q(q-1)/2. It is maximal over  $\mathbb{F}_{q^2}$  because  $\#X_q(\mathbb{F}_{q^2}) = q^3 + 1$ .

**Ruck/Stichtenoth:**  $X_q$  is unique curve of genus g maximal over  $\mathbb{F}_{q^2}$ .

**Hansen:**  $X_q$  is the Deligne-Lusztig variety for  $Aut(X_q) = PGU(3, q)$ .

The zeta function of  $X_q$  is  $Z(X_q/\mathbb{F}_q, t) = \frac{(1+qt^2)^g}{(1-t)(1-qt)}$ . The only slope of the Newton polygon of  $L(t) = (1+qt^2)^g$  is 1/2.

Thus  $Jac(X_q)$  is supersingular.

**C.** The group scheme E[p] contains 1 copy of  $\alpha_p$ , the kernel of Frobenius on  $\mathbb{G}_a$ .

As a *k*-scheme,  $\alpha_p \simeq \text{Spec}(k[x]/x^p)$  with co-multiplication  $m^*(x) = x \otimes 1 + 1 \otimes x$  and co-inverse  $\text{inv}^*(x) = -x$ .

E[p] is a group scheme of rank  $p^2$ , fitting in a non-split exact sequence

$$0 \rightarrow \alpha_{\rho} \rightarrow E[\rho] \rightarrow \alpha_{\rho} \rightarrow 0.$$

The image of  $\alpha_p$  is the kernel of *F* (Frobenius) and *V* (Verschiebung).

### What is a good generalization of this condition?

## First approach - the a-number

Let  $\alpha_p$  denote the kernel of Frobenius on  $\mathbb{G}_a$ .

#### Definition

The *a*-number of *A* is  $a(A) = \dim_k \operatorname{Hom}(\alpha_p, A[p])$ .

**Computation:** Let *X* be a curve of genus *g*. Let *r* be the rank of the Cartier operator on  $H^0(X, \Omega^1)$ . Then the *a*-number of A = Jac(X) is a = g - r.

#### Example - the Hermitian curve

Let  $q = p^n$ . Recall that  $X_q : y^q + y = x^{q+1}$  has genus g = q(q-1)/2.

If n = 1, then a = g. If n = 2, then a = g/2.

Gross:  $a = p^n (p^{n-1} + 1)(p-1)/4$ .

## Computation of a-number of Hermitian curve

The Cartier operator *C* acts on  $H^0(X_q, \Omega^1)$ .

Let 
$$\Delta = \{(i,j) \mid i,j \in \mathbb{Z}, i,j \ge 0, i+j \le q-2\}.$$
  
A basis for  $H^0(X_q, \Omega^1)$  is  $B = \{\omega_{i,j} := x^i y^j dx \mid (i,j) \in \Delta\}.$ 

Write  $i = i_0 + pi_n^T$  and  $j = j_0 + pj_n^T$  with  $0 \le i_0, j_0 \le p - 1$ .

$$C(x^{i}y^{j}dx) = x^{i_{n}^{T}}y^{j_{n}^{T}}C\left(x^{i_{0}}(x^{q+1}-y^{q})^{j_{0}}dx\right)$$
  
=  $x^{i_{n}^{T}}y^{j_{n}^{T}}\sum_{l=0}^{j_{0}}\binom{j_{0}}{l}(-1)^{l}x^{p^{n-1}(j_{0}-l)}y^{p^{n-1}l}C\left(x^{i_{0}+j_{0}-l}dx\right).$ 

 $C(x^k dx) \neq 0$  iff  $k \equiv -1 \mod p$ . Need  $i_0 + j_0 - \ell \equiv -1 \mod p$ .

If  $i_0 + j_0 , then <math>C(\omega_{i,j}) = 0$ . If  $i_0 + j_0 \ge p - 1$ , then  $C(\omega_{i,j}) = \omega_{p^{n-1}(p-1-i_0)+i_n^T, p^{n-1}(i_0+j_0-(p-1))+j_n^T}$ . Let *A* be a p.p. abelian variety of dimension *g* over  $k = \overline{k}$ , char(k) = p.

Recall  $a(A) = \dim_k \operatorname{Hom}(\alpha_p, A[p])$ , with  $\alpha_p$  kernel of Frobenius on  $\mathbb{G}_a$ .

**Def:** An abelian variety *A* is *superspecial* if a(A) = g.

Let *E* be a supersingular elliptic curve over k.

## Oort

A is supersingular iff  $A \sim E^g$  is ISOGENOUS to a product of supersingular elliptic curves.

A is superspecial iff  $A \simeq \times_{i=1}^{g} E_i$  is ISOMORPHIC to a product of supersingular elliptic curves.

< ロ > < 同 > < 回 > < 回 >

**Abelian varieties:** The number of superspecial p.p. abelian varieties of dim *g* is finite and non-zero; (it is a class number).

The superspecial locus of  $\mathcal{A}_g$  has dimension 0.

Smooth curves: Problem: there are not many superspecial curves.

**Example:** The Hermitian curve  $X_q : y^q + y = x^{q+1}$  is supersingular for all  $q = p^n$ , but superspecial iff n = 1.

#### Ekedahl

If  $X/\overline{\mathbb{F}}_p$  is a superspecial curve of genus g, then  $g \leq p(p-1)/2$ .

Upper bound realized by Hermitian curve  $X_p: y^p + y = x^{p+1}$ .

## Another approach - Dieudonné module

The Dieudonné module D(A[p]) of the group scheme A[p] is an  $\mathbb{E}$ -module.

Here  $\mathbb{E} = k[F, V]$  is the non-commutative ring generated by semi-linear operators *F* and *V* with relations FV = VF = 0 and  $F\lambda = \lambda^{\rho}F$  and  $\lambda V = V\lambda^{\rho}$  for all  $\lambda \in k$ .

Let  $(R) = \mathbb{E}R$  be the left ideal of  $\mathbb{E}$  generated by R.

Let *E* be a supersingular elliptic curve. Let  $I_{1,1}$  be the isomorphism class of the rank  $p^2$  group scheme E[p]. The Dieudonné module of  $I_{1,1}$  is  $\mathbb{E}/(F + V)$ 

### Fact:

A is superspecial if and only if  $A[p] \simeq (I_{1,1})^g$ . A is superspecial if and only if  $D(A[p]) = (\mathbb{E}/(F+V))^g$

Let  $q = p^n$ . Recall that  $X_q : y^q + y = x^{q+1}$  has genus g = q(q-1)/2. Let  $\mathbb{D}(X_q)$  denote the Dieudonné module of  $Jac(X_q)[p]$ .

#### Theorem -Pries/Weir

We determine the Dieudonné module  $D(X_q)$  for all  $q = p^n$ , complementing earlier work of Dummigan. Its distinct indecomposable factors are in bijection with orbits of  $\mathbb{Z}/(2^n + 1) - \{0\}$  under  $\times 2$ .

#### **Examples:**

$$\begin{split} \mathbb{D}(X_p) &= (\mathbb{E}/(F+V))^g. \\ \mathbb{D}(X_{p^2}) &= (\mathbb{E}/(F^2+V^2))^{g/2}. \\ \mathbb{D}(X_{p^3}) &= (\mathbb{E}/\mathbb{E}(F^3+V^3))^{r_{3,2}} \oplus (\mathbb{E}/\mathbb{E}(F+V))^{g-3r_{3,2}}, \\ \text{where } r_{3,2} &= p^3(p+1)^2(p-1)/2^3. \end{split}$$

Let X be a supersingular curve of genus g.

Recall that  $Jac(X) \sim E^g$  with *E* supersingular elliptic curve.

But, almost always,  $Jac(X) \simeq \times_{i=1}^{g} E_i$ .

Find an invariant that measures the extent to which Jac(X) decomposes up to isomorphism.

The *a*-number is not good.

Could have large *a*-number even when Jac(X) indecomposable.

The Dieudonné module is too complicated. There are  $2^g$  options for the DM,  $2^{g-1}$  when the *p*-rank is f = 0. The DM could have many factors even when Jac(X) indecomposable.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

# Superspecial rank

Let A be a p.p. abelian variety of dimension g over k.

### Definition

The superspecial rank s(A) is the multiplicity of  $\mathbb{E}/(F+V)$  in the Dieudonné module of A[p].

Fact: s(A) is the dimension of Ker(F + V) on  $H_{dR}^1(A)$ .

If A ordinary, then s(A) = 0.

In fact,  $0 \le s(A) \le a(A) \le g - f(A)$ 

because each factor of  $\mathbb{E}/(F + V)$  contributes to the *a*-number and because f(A) is the multiplicity of  $\mathbb{Z}/p \oplus \mu_p$  in A[p].

Also s(A) = g iff A is superspecial.

Name	cod	f	а	ν	μ	Dieudonné module	s(A)
L	0	1	0	[1]	Ø	$\mathbb{E}/(F,1-V)\oplus\mathbb{E}/(V,1-F)$	0
<i>I</i> <sub>1,1</sub>	1	0	1	[0]	<b>{1</b> }	$\mathbb{E}/(F+V)$	1

The isomorphism type of the *p*-torsion of an elliptic curve *E* is:  $L = \mathbb{Z}/p \oplus \mu_p$  if *E* is ordinary  $I_{1,1}$  if *E* is supersingular

Here  $\mathbb{E}$  is the non-commutative ring generated by semi-linear operators *F* and *V* with the relations FV = VF = 0 and  $F\lambda = \lambda^{\rho}F$  and  $\lambda V = V\lambda^{\rho}$  for all  $\lambda \in k$ ; and ( $\rho$ ) denotes the left ideal of  $\mathbb{E}$  generated by  $\rho$ .

Name	cod	f	а	ν	μ	Dieudonné module	s(A)
L <sup>2</sup>	0	2	0	[1,2]	Ø	$D(L)^{2}$	0
$L \oplus I_{1,1}$	1	1	1	[1,1]	<b>{1</b> }	$D(L) \oplus \mathbb{E}/(F+V))$	1
<i>I</i> <sub>2,1</sub>	2	0	1	[0,1]	<b>{2</b> }	$\mathbb{E}/(F^2+V^2)$	0
$I_{1,1}^2$	3	0	2	[0,0]	$\{2,1\}$	$(\mathbb{E}/(F+V))^2$	2

The supersingular locus contains both types  $(I_{1,1})^2$  and  $I_{2,1}$ .

The group scheme A[p] does not determine the NP of A when  $g \ge 3$ .

If  $A[p] \simeq I_{3,1}$ , then the NP of A is usually  $G_{1,2} + G_{2,1}$  (three slopes of 1/3 and 2/3) but it can also be  $3G_{1,1}$  (supersingular).

Pries (CSU)

The *p*-torsion A[p] is a group scheme of rank  $p^{2g}$ .

The isomorphism class of A[p] is determined by its Ekedahl-Oort type.

Find *final filtration*  $N_1 \subset \cdots \subset N_{2g}$  of D(A[p]) as *k*-vector space, stable under the action of *V* and  $F^{-1}$  such that  $i = \dim(N_i)$ .

The *Ekedahl-Oort type* is  $v = [v_1, ..., v_g]$  where  $v_i = \dim(V(N_i))$ .

There are nec/suff conditions  $v_i \leq v_{i+1} \leq v_i + 1$  on v.

There are  $2^g$  possibilities for the isomorphism class of A[p].

A (10) F (10)

-

#### Lemma

For all p and  $g \ge 2$ , a generic supersingular p.p. abelian variety has superspecial rank 0.

Proof: A generic supersingular p.p. abelian variety has *p*-rank 0 and *a*-number 1 Li/Oort.

This forces DM to be  $\mathbb{E}/(F^g + V^g)$ , thus superspecial rank 0 for  $g \ge 2$ .

#### Remark:

Most abelian varieties with  $DM = \mathbb{E}/(F^g + V^g)$  are not supersingular. An EO strata is fully contained in supersingular locus iff smaller than  $[0, 0, ..., 0, 1, 2, ..., \lfloor \frac{g}{2} \rfloor]$ .

イロト イポト イヨト イヨト 二日

Classify all the supersingular ranks which occur for supersingular abelian varieties

### Proposition

For all p and g, there exists a supersingular abelian variety of dimension g over  $\overline{\mathbb{F}}_p$  with superspecial rank s if and only if  $0 \le s \le g-2$  or s = g.

#### Proof sketch:

There exists a supersingular abelian variety  $A_1$  of dim g - s with a = 1.

The DM is  $\mathbb{E}/(F^{g-s}+V^{g-s})$  so  $s(A_1)=0$  as long as  $s\neq g-1$ .

Let  $A = E^s \times A_1$  where *E* is a supersingular elliptic curve.

## Application of superspecial rank to Selmer groups

Let *K* be the function field of a curve over *k* and *v* place of *K*. Let  $f : A \rightarrow A'$  be an isogeny of abelian varieties over *K*.

#### Motivation - superspecial rank

Let *A* be a constant supersingular elliptic curve over *K* and f = [p]. Ulmer: The rank of Sel(*K*,[*p*]) is the superspecial rank.

Tate-Shafarevich group:  $\operatorname{III}(K, A)_f = \operatorname{Ker}(\operatorname{III}(K, A) \to \operatorname{III}(K, A'))$ where  $\operatorname{III}(K, A) = \operatorname{Ker}(H^1(K, A) \to \prod_{\nu} H^1(K_{\nu}, A)).$ 

Selmer group: Sel(K, f) is subset of  $H^1(K$ , Ker(f)) s.t. restriction is in image of Sel( $K_v$ , f) = Im( $A'(K_v) \rightarrow H^1(K_v, \text{Ker}(f))$ ) for all v.

Exact sequence  $0 \to A'(K)/f(A(K)) \to \operatorname{Sel}(K, f) \to \operatorname{III}(K, A)_f \to 0.$ 

# (supersingular)-Elliptic rank

Let A be an abelian variety of dimension g over k.

#### Definition

The supersingular elliptic rank e(A) of A is

$$\boldsymbol{e}(\boldsymbol{A}) := \max\{\boldsymbol{e} \mid \iota : \boldsymbol{A} \xrightarrow{\simeq} \boldsymbol{B} \times (\times_{i=1}^{\boldsymbol{e}} \boldsymbol{E}_i)\},\$$

 $E_i$  supersingular elliptic curves, *B* abelian variety of dimension g - e, and  $\iota$  an isomorphism of abelian varieties.

**Note:**  $0 \le e(A) \le s(A)$  because each  $E_i$  contributes a factor of  $\mathbb{E}/(F+V)$  to the Dieudonné module

If A absolutely simple, then e(A) = 0.

**Lenstra/Oort:** If  $\eta$  non-supersingular symmetric formal isogeny type, there exists a simple abelian variety *A* with isogeny type  $\eta$ . There are many *A* with s(A) > 0 and e(A) = 0.

Pries (CSU)

## An observation of Oort

If A is supersingular, then the supersingular elliptic rank e(A) of A equals the superspecial rank s(A) of A.

**Proof sketch:** Know  $e \le s$ . Let *E* be supersingular elliptic curve.

Write  $A[p^{\infty}] \simeq G_{1,1}^s \times Z$  with s(Z) = 0. Since A supersingular,

there exists a finite group scheme  $N \hookrightarrow G_{1,1}^{g-s}$  s.t.  $Z \simeq G_{1,1}^{g-s}/N$ .

Now  $E^{g-s}$  and  $G_{1,1}^{g-s}$  have the same finite subgroup schemes.

So  $N \hookrightarrow E^{g-s}$ ; it follows that  $A \simeq E^s \times (E^b/N)$  and  $e(A) \ge s$ .

#### Proposition - revised

For all *p* and  $g \ge 2$  and  $0 \le s \le g-2$ , there exists a supersingular abelian variety of dimension *g* over  $\overline{\mathbb{F}}_p$  with supersingular elliptic rank *s*.

Thus  $A \sim E^g$  with E ss, and  $A \simeq B \times (\times_{i=1}^s E_i)$  but  $A \not\simeq C \times (\times_{i=1}^{s+1} E_i)$ .

#### Question

Given *p* and  $g \ge 2$  and  $0 \le s \le g - 2$ ,

does there exist a supersingular curve X over  $\overline{\mathbb{F}}_{p}$  with genus g whose Jacobian has supersingular elliptic rank s?

# Supersingular elliptic rank of Hermitian curves

The Hermitian curve  $X_q : y^q + y = x^{q+1}$  with  $q = p^n$  is supersingular with genus g = q(q-1)/2.

**P**/Weir: The distinct indecomposable factors of Dieudonné module  $D(X_q)$  are in bijection with orbits of  $\mathbb{Z}/(2^n+1)-\{0\}$  under  $\times 2$ . Example:  $D(X_{p^2}) = (\mathbb{E}/(F^2+V^2))^{g/2}$ .

Check: if *n* even, then  $\mathbb{E}/(F + V)$  is not a factor of  $D(X_{p^n})$ .

Combinatorial reason: *n* odd iff there is an element of order three in  $\mathbb{Z}/(2^n+1)$  iff there is an orbit of length 2 in  $\mathbb{Z}/(2^n+1)$  under  $\times 2$ .

## Application: P/Weir

If *n* is even, the supersingular elliptic rank of  $Jac(X_{p^n})$  equals 0. If *n* is odd, the supersingular elliptic rank of  $Jac(X_{p^n})$  equals  $(\frac{p(p-1)}{2})^n$ .

Let X be a smooth projective curve over k. Let D(X) be the Dieudonné module of the p-torsion of Jac(X).

**Oda:** isomorphism of  $\mathbb{E}$ -modules between D(X) and  $H^1_{dR}(X)$ .

#### **Exact sequence:**

$$0 \to H^0(X, \Omega^1) \to H^1_{\mathrm{dR}}(X) \to H^1(X, \mathcal{O}) \to 0.$$

Compute the structure of  $H_{dR}^1(X)$  under *F* and *V*. Write  $(f, \omega) \in H_{dR}^1(X)$  where  $d\phi = \omega_1 - \omega_2$ . Then  $F(f, \omega) := (f^p, 0)$  and  $V(f, \omega) := (0, C(\omega))$ , where *C* is the Cartier operator on  $\Omega^1$ .

# ss-Elliptic rank of hyperelliptic curves when p = 2

Let *Y* be a hyperelliptic curve of genus *g* over  $k = \overline{\mathbb{F}}_2$ . Then  $Y : y^2 + y = h(x)$  for some  $h(x) \in k(x)$ .

Theorem - Elkin/P

We determine structure of Dieudonné module of Jac(Y). It depends only on the orders of the poles of h(x).

E.g., *p*-rank 0 iff  $h(x) \in k[x]$  iff the EO type is  $[0, 1, 1, 2, 2, \dots, \lfloor \frac{g}{2} \rfloor]$ .

### Application: Elkin/P

Let *Y* be a supersingular hyperelliptic curve of genus *g* over  $\overline{\mathbb{F}}_2$ . Let *e* be the supersingular elliptic rank of Jac(*Y*). Then e = 1 when  $g \equiv 1 \mod 3$  and e = 0 otherwise.

Such curves exist: if h(x) = xR(x) for an additive polynomial R(x) of degree 2<sup>*s*</sup>, then *Y* is supersingular of genus 2<sup>*s*-1</sup> VdG/VdV.

Let p = 2, let  $q_0 = 2^m$  and let  $q = 2^{2m+1}$ .

The Suzuki curve  $S_q$  has equation  $y^q + y = x^{q_0}(x^q + x)$ . It is supersingular with genus  $q_0(q-1)$ .

**Furlmann/Torres:**  $S_q$  is the unique  $\mathbb{F}_q$ -optimal curve of genus g.

**Hansen92:**  $S_q$  is the Deligne-Lusztig curve for group  $Sz(q) = {}^2B_2(q)$ .

#### Application: Malmskog/P/Weir

The ss-elliptic rank of  $Jac(S_q)$  is 1 when *m* even and is 0 when *m* odd.

# Proof - supersingular elliptic rank of $S_q$

The Suzuki curve  $S_q$  has genus  $q_0(q-1)$  where  $q_0 = 2^m$ ,  $q = 2^{2m+1}$ .

Application: Malmskog/P/Weir

The ss-elliptic rank of  $Jac(S_q)$  is 1 when *m* even and is 0 when *m* odd.

**Proof:** Consider tame action of  $T \simeq \mathbb{Z}/(q-1)$  on  $S_q$ .

Giulietti, Korchmaros, Torres: The quotient  $S_q/T$  is a supersingular hyperelliptic curve of genus  $q_0$ . (must also have *p*-rank 0).

Applying Elkin/P to  $S_q/T$ , the *old ss-elliptic rank* is 1 when  $q_0 \equiv 1 \mod 3$  (even *m*) and is 0 when  $q_0 \equiv 2 \mod 3$  (odd *m*).

The *new elliptic rank* is zero: the orbits of action of *F* on non-trivial eigenspaces of  $H^1_{dR}(S_q)$  are too long.

Supersingular curves with ss-elliptic rank 0 when p = 2

## P: Let p = 2. Let $r, s \in \mathbb{N}$ with s even. Let $q = 2^r$ .

There exists a supersingular curve *Y* of genus  $g = 2^{s-1}(q-1)$  with ss-elliptic rank 0.

If *s* odd, let  $\alpha = \operatorname{val}_3(q-1)$  and  $\beta = \operatorname{val}_3(2^s+1)$ . Then ss-elliptic rank of *Y* is bounded by  $3^{\alpha}(3^{\beta}-1)/2$ .

**Proof:** Use VdG/VdV to construct supersingular curve of genus g, with automorphism of large prime-to-p order.

*Old* elliptic rank bounded by that of quotient curve. *New* elliptic rank zero because orbits of action of *F* on non-trivial eigenspaces of  $H^1_{dR}(Y)$  too long.

With Malmskog and Weir, computing the DM of the Suzuki curves.

**Examples** If m = 1, then  $DM = \mathbb{E}/(F^2 + V^2) \oplus (\mathbb{E}/(F^3 + V^3))^4$ .

If m = 2, then  $\mathrm{DM} = \mathbb{E}/(F + V) \oplus \mathbb{E}/(F^3 + V^3) \oplus D^4 \oplus (\mathbb{E}/(F^5 + V^5))^{16}$ 

where D has 3 generators (given by word  $F^{-4}V^3F^{-3}V^4F^{-3}V^3$ ).

Strategy: find structure in general using representation theory.

# Conclusion

The superspecial rank is an invariant of the DM of abelian variety A.

If A supersingular, then it equals the number of superspecial elliptic factors in the decomposition of A up to isomorphism.

Superspecial rank is generically 0 for supersingular abelian varieties.

Expect same is true for supersingular Jacobians of curves

## Questions

- The supersingular locus S<sub>g</sub> of A<sub>g</sub> can be stratified by superspecial rank into subspaces S<sub>g,s</sub>.
  For 0 ≤ s ≤ g − 2, what is the geometry of S<sub>g,s</sub>?
- What superspecial ranks occur for supersingular curves?
- 3 If A supersingular, understand connection between superspecial rank and properties of the isogeny  $A \sim E^g$ .
